[57] **ABSTRACT**

A method of treatment of acne rosacea consists of the
application, in the form of either a lotion or a cream,
constituting a mixture of a therapeutically effective amount
of ivermectin in water, in the case of the lotion, and
ivermectin and a pharmaceutically acceptable carrier, in the
case of the cream. Application to the affected area occurs
daily for a period of one week and, thereafter, two to four
times per month for a period of up to one year.
